Bending beam, model F3833

Description

Bending beams are designed for static and dynamic measurement tasks. They determine the forces or the weight in a wide scope of applications.

These load cells are used in industrial weighing and laboratory as well as in the process industry. They are also used for gravimetric level measurement of vessels such as silo or tanks.

The bending beams of model F3833 are made of stainless steel, which are particularly suitable for the application areas of scales, process industry and laboratory.

The output signal is a mV/V signal.

Note

In order to avoid overloading, it is advantageous to connect the load cell electrically during installation and to monitor the measured value. The force to be measured must be applied concentrically and free of transverse force. The bending beams are to be mounted on a level surface.
